GIT · GITHUB · OPEN SOURCE

Git, GitHub & Open Source

From first commit to first pull request.

Prepared by Hubert

WHO IS TALKING

Hi, I'm Hubert.

I'll take you from the first commit to a real contribution.

Today’s agenda

01	What version control is, and why it exists	PART 1
02	Git, and how it differs from GitHub	PART 1
03	The everyday workflow: edit, stage, commit, push	PART 1
04	Fork, clone, branch: how open source works	PART 2
05	Your first pull request, step by step	PART 2

BEFORE WE START

House rules

3

rules for the
next few minutes

Keep the room alive

Ask the moment a question appears in your head.

Laptop open. Follow along, don't just watch.

Confused is allowed. Silent and confused is not.

PART 1 · THEORY

Git and GitHub for absolute beginners.

Understand the why first. The commands will make sense after.

01 · VERSION CONTROL

What is version control?

Version control records every change you make to your files, so you can go back to any version later.

It also shows **who changed what, and when.** That s what makes teamwork on code possible.

v1	final.zip
v2	final2.zip
v3	final_REAL.zip Sound familiar?

WITHOUT IT, YOU HEAR

“It worked yesterday.” **“Whose version is this?”** **“Which one is final?”**

What is Git?

1 **Local**

Runs on your computer. No account needed.

2 **Snapshots**

Every commit saves your whole project.

3 **Branches**

Try ideas without breaking what works.

4 **History**

Go back to any version, any time.

Git is not GitHub

GIT

The tool on your computer

Saves versions of your work and works offline. Think of it as the camera taking photos of your code.

GITHUB

The place on the internet

A website that stores those photos online, shows them to the world, and lets people work on them with you.

From your laptop to GitHub

STEP 1

your project folder

Edit

Change your files as usual: code, docs, anything.

STEP 2

git add

Stage

Choose which changes go into the next snapshot.

STEP 3

git commit

Commit

Save a snapshot with a short, clear message.

Every commit is a safe checkpoint

STEP 4

git push

Push

Send your commits up to GitHub.

STEP 5

on github.com

Pull request

Ask the project to review your change and merge it.

ON YOUR COMPUTER · GIT

ON THE INTERNET · GITHUB

PART 2 · PRACTICE

Your first open source contribution.

Open source code is public. Anyone can read it, use it, and improve it.

Fork, clone, branch

Fork

Your own copy of someoné s project, on your GitHub account.

Clone

Download your fork to your laptop so you can work on it.

Branch

A safe lane for one change. The main code stays untouched.

05 · YOUR FIRST PULL REQUEST

9 steps to your first PR

Practise every step on the first-contributions repo. Scan to open it.

01 Create a GitHub account	02 Fork the project	03 Clone your fork
04 Create a branch	05 Make a small change	06 Commit with a clear message
07 Push to your fork	08 Open a pull request	09 Reply to review, get merged

The only commands you need

`git clone <url>`	Bring the project to your laptop
`git switch -c my-fix`	Create your own safe lane
`git add .`	Stage your changes
`git commit -m "Fix typo"`	Save them with a clear message
`git push origin my-fix`	Send your branch to your fork

LIVE DEMO

Screen on. Let's do it together.

Follow along on your laptop: fork, clone, branch, change, commit, push, open a pull request.

Create a GitHub account →

Scan to sign up

05 · AFTER TODAY

Your first issue can be small. Just finish it.

On a project s Issues tab, filter by these labels:

> **good first issue · documentation · bug**

Before you write code

Read it twice

Make sure you understand what is being asked.

Claim it

Comment: I"d like to work on this." Then wait for a reply.

Reproduce it

See the problem yourself first. Understanding beats guessing.

Your turn.

→ Fork one project this week.

→ Open one small pull request. A typo fix counts.

→ Ask questions now. They'll never be cheaper than they are today.
